

Imperial Star - Globe Artichoke Seed

Cynara scolymus

Average 28 seeds / gram (800/oz).

Planted and harvested in one season.

Green Globe thorn less Imperial Star Artichokes have a nice uniform globe round shape, excellent quality for eating, tending to be noticeably sweeter and tenderer than other artichoke varieties. For best sweet flavor it should be harvested at 12 cm. (4.5") diameter.

Average yield, 16-20 tons/hectare (6-8 Tons/acre, based on direct seedling results in California). Perennial Compact very large plants, can be spaced 40 cm (18") apart in rows 120-150 cm. (3'-5') apart, Starting production from transplants is recommended, rather than direct seeding, allowing for better uniformity, earlier planting season and much easier mechanical weed control. About 85-95 days from planting to harvest. The Imperial Star can be planted and harvested at the same year. Keeping good sanitation and with favorable weather condition the plantation, maintains vigorous yield for 3 – 4 years
